Security for your Gas Station

Gasoline theft, shoplifting or assault: prevention and education

Motorists fill up without paying!

In 2017, 71,481 individual offences were recorded. In the following year 2018, 72,424 cases of fuel fraud were registered by the police in Germany (source: Police Crime Statistics of the Federal Republic of Germany).

The situation is similar in many countries of the world, with a rising price of gasoline directly related to the number of offenses. Unfortunately, gas station shops, equipped like mini-supermarkets with openings times late into the night are also confronted with increased incidents of theft and even robbery. A professional, system-wide security concept, the image quality of the embedded video security system and perfectly coordinated data exchange between the individual systems are critical factors for the prevention and investigation of these offenses.

Our solution secures your work processes and provides help, not just after the incident has already happened.

The advantages at a glance

Gasoline theft, don't let it happen to you!

A quick glance can save you money. Your video analysis automatically shows who wants to fill up at your station. You can decide whether fueling can take place without asking.

Razor sharp

Megapixel camera pictures show you every last detail. You can see immediately who you're dealing with - a regular customer or a masked stranger with an illegible license plate number.

Securing evidence

Your cashier system controls image storage - perfectly aligned interfaces in a homogeneous overall system. Everything is documented, with no gaps. No tedious searches - find each operation in seconds.

Lanes and fuel pumps

Using the modern movement detection algorithms your Geutebrück video analysis can identify which pump the customer stopped at. The corresponding, high-resolution video images are displayed on your work monitor. You can now make your decision and turn the pump on or leave it off. Guilty? Masked, potential thieves will immediately „head for the hills“. Everyone else will enter the gas station and talk to you in person ...

The fueling process

Video recording of a fueling operation is activated when the nozzle is removed and terminated when the nozzle is put back. The information from your cashier system is linked with the video images and saved. Pump number, time, date, number of liters and amount paid can later serve as search criteria. In addition, the previously recorded video analysis can be linked to this filling process.

Point of sale

Each payment transaction is documented by the images of your cashier camera and can be automatically linked to the recording of the fueling procedure. As a result, you have the perfect video documentation for each fueling process.

Shop

Your entire product range in the shop is recorded by wide-angle cameras. The entrance and exit areas are documented by high-resolution pictures at close range for subsequent identification of faces. With the automatic, permanent recording, every move in your store is documented. Additionally, with the press of a button you can take recordings in suspicious moments and show them quickly at any time.

Evaluation

It happened! Now you have to react quickly. Our filters can find any recording in a split second. View, copy, export, forward or send – all performed quickly and easily. Usability – intuitive, simple and self-explanatory.

A homogenous system

Perfectly integrated interfaces fulfil every need. We work with you to develop the perfect security and operating concept. Detailed planning is the key to success.

Options

And we can do even more for you.

Our product portfolio offers a wide range of expansion options for your Geutebrück video security system.

From number plate recognition that automatically reports illegible plates or compares plates with a black list, to the smartphone app that provides access to your security system video on the go.

Everything is flexible.

Everything is compatible.

Everything is just how you need it.

The screenshot displays a software interface for video security management. It features a top menu bar with options like 'Datei', 'Anzeige...', 'Bearbeiten...', 'Optionen', and 'Hilfe'. On the left, there is a tree view of camera locations and a filter panel with options for 'Normal', 'Alle aktuellen Fahrzeuge', and 'Zitbereich wählen', along with date and time range selectors. The main area contains four video feeds from different camera angles. Below the feeds is a playback control bar with play, stop, and navigation buttons. At the bottom, a data table lists vehicle entries with columns for 'Sequenz ID', 'Kennzeichen', 'Fahrzeug', 'Erfahrdatum', 'Fahrspur Zufahrt', 'Firma', 'Aufahrdatum', 'Fahrspur Ausfahrt', 'Firmenkategorie', 'Fahrer 1', 'Standdauer', and 'Zugangsstatus'.

Sequenz ID	Kennzeichen	Fahrzeug	Erfahrdatum	Fahrspur Zufahrt	Firma	Aufahrdatum	Fahrspur Ausfahrt	Firmenkategorie	Fahrer 1	Standdauer	Zugangsstatus
